To whom it may concern,

The Group of Professor Zernicka-Goetz is pleased to provide this letter of support and reference to Atinea Sp. z o. o., provider of the instadb.com development platform.

Our team is a part of the University of Cambridge. We are focused on the investigation of the development of the early mouse embryo. One of the most important tasks in every laboratory is effective management of equipment and reagents.

Our group successfully launched customized database using instadb.com platform. We have implemented database of antibodies, plasmids, siRNA, protocols and other resources used in the laboratory on a daily basis. The process of development was performed by a scientist without IT background, what proves that the instadb.com platform is easy and intuitive. The usage of the platform is comfortable and effective and help to keep our laboratory in order.

We are deeply satisfied with the application built on the instadb.com platform. As scientists we must use only the tools, which are reliable and good working and the instadb.com is definitely one of them.

I would be pleased to respond to any specific questions.

Yours sincerely,

Anna Hupalowska
